This article presents a theoretical analysis of scientific researches related to medical lexicon in English linguistics. At the same time, definitions of the healing concept given in explanatory dictionaries were studied.

Keywords: medical lexeme, linguocultural science, doctor's lexeme, lexical unit.

We know that language units and the linguistic symbols attached to them do not express a frozen or static nature, and are constantly undergoing a process of renewal and change under the influence of time and space. Consequently, lexicology, as a field of systematic and systematic study of the vocabulary of the language, shows the total units belonging to this content and linguistic phenomena related to them. The field that studies the vocabulary of a language is called lexicology. In fact, the word "lexis" (Greek: lexis - word, expression, lexikos - relating to the word) means the collection of words of the language or the vocabulary of the language. Although the word is accepted as a lexical unit, the lexical unit also includes stable compounds. Instead of lexicon, different layers of vocabulary are understood: medical lexicon, household lexicon, book lexicon, colloquial lexicon, poetic lexicon (as well as the lexicon of a certain creator).

In English, the lexeme of *tibbiyot* is represented by the word *medicine*. *Medicine is the science and practice of the diagnosis, prognosis, treatment, and prevention of disease. The word "medicine" is derived from Latin medicus, meaning a*

*physician*¹[Tibbiyot - bu kasallikning tashxisi, prognozi, davolash va oldini olish bo'yicha fan va amaliyot. "Tibbiyot" so'zi lotincha medicus so'zidan olingan bo'lib, "shifokor" degan ma'noni anglatadi].

In order to study the explanations given about the medicine lexeme in the English language, we focus on the definitions given in the dictionaries of the English language.

According to the famous "Oxford Advanced American Online Dictionary" of the English language *the study and treatment of diseases and injuries*² [kasalliklar va bemorlarni o'rganish va davolash].

"According to the annotation to the Cambridge Advanced Learner's Dictionary & Thesaurus online" 1. *medicine a substance, especially in the form of a liquid or a pill, that is a treatment for illness or injury: Take two spoonfuls of medicine at mealtimes. She knows a lot about herbal medicines* [dori-darmon, ayniqsa suyuqlik yoki hap shaklida, kasallik yoki jarohatni davolovchi modda: Ovqatlanish vaqtida ikki qoshiq dori iching. U o'simlik preparatlari haqida ko'p narsalarni biladi], 2. *the science dealing with the preserving of health and with preventing and treating disease or injury.* [salomatlikni saqlash, kasallikning va davolash bilan shug'ullanadigan fan], 3. *a substance taken into the body in treating an illness* [kasallikni davolashda tanaga olinadigan modda], 4. *the treatment of illness or injury, or the study of how illnesses and injuries are treated* [kasallik yoki jarohatni davolash yoki kasallik va jarohatlar qanday davolashni o'rganish], 5. *a drug that is used to treat illness or injury*³ [kasallik yoki jarohatni davolash uchun ishlatiladigan dori].

Another is given in the famous "Longman Dictionary of Contemporary English Online" dictionary of the English people 1. *medicine or drugs given to people who are ill* 2. *the treatment and study of illnesses and injuries*⁴ [kasal kishilarga beriladigan dori yoki dori 2. kasallik va jarohatlarni davolash va o'rganish].

Based on the definitions given to the lexeme medicine in the above explanatory dictionaries of the English language, it can be noted. This lexicon expresses such meanings as disease, treatment of patients, medicine, healing.

One of the studies conducted on the comparative study of the medical lexicon of English with other languages is the book "Common Medical Terms and Phrases"

published by Indian researchers. This book contains about six thousand terms, more than a thousand of which are different. are disease names. English and Hindi versions of the terms given along with Su are given⁵.

If we look at the scientific research on this field in English linguistics, in the book "Understanding the language of medicine" by the researcher Rosita Maglie "*medical terms are studied first diachronically and then synchronically. The author researched the medical terms linguistically (lexically, semantically) and methodologically, and provided necessary information about the interaction of the doctor with patients and their families, scientific communication, and translators in the field of medicine in the oral medical discourse. In the written text analysis section, he revealed the types of medical texts and their special aspects*"⁶ [tibbiy atamalar avval diaxronik, keyin esa sinxron tarzda o'rganiladi. Muallif tibbiy atamalarni lingvistik (leksik, semantik) va uslubiy jihatdan tadqiq qilib, og'zaki tibbiy nutqda shifokorning bemorlar va ularning oila a'zolari bilan o'zaro munosabati, ilmiy muloqoti, tibbiyot sohasidagi tarjimonlar haqida zarur ma'lumotlarni bergan. Yozma matn tahlili bo'limida tibbiy matnlarning turlari va ularning alohida jihatlarini ochib bergan].

In the book "The amazing language of medicine: understanding medical terms and their backstories" by researcher B. Robert *medicine is the most incomparable work on etymological research of English medical terms. In this book, the lexical, semantic, and stylistic analysis of medical terms and their interesting history are detailed. For example, the author writes about the words used in this field*⁷ [bu ish ingliz tibbiyot atamalarini etimologik tadqiq qilish bo'yicha eng beqiyos ishlardan biridir. Ushbu kitobda tibbiy atamalarning leksik, semantik va stilistik tahlili va ularning qiziqarli tarixi batafsil yoritilgan. Masalan, muallif bu sohada qo'llanilgan so'zlar haqida ham ma'lumot bergan].

Today, it is important to provide information to the general public about the correct application and interpretation of the medical lexicon in our language, the scope of their use and related problems. It is desirable to study it in the form of a whole system - system-structure, because it has all the characteristics of lexical units related to the field.
