TARTIBLI STATISTIKALAR YIG'INDILARI UCHUN BA'ZI LIMIT

TEOREMALAR

Boltayeva N. B.

boltayevan27@gmail.com

Aytaylik

$$X_1, \dots, X_n$$

o'zaro bog'liqsiz, bir xil taqsimlangan tasodifiy miqdorlar bo'lib,

$$X_n^{(k)}$$

kamayish tartibida joylashtirilgan

$$(X_n^{(n)} \leq X_n^{(n-1)} \leq \dots \leq X_n^{(1)})$$

ga mos tartibli statistikalarni,

$$S_0 = 0, S_n = X_1 + \dots + X_n$$

va ixtiyoriy fiksirlangan

$$r, 0 \leq r \leq n$$

uchun

$$S_n^{(r)} = S_n - \sum_{k=1}^r X_n^{(k)} = \sum_{k=r+1}^n X_n^{(k)}$$

deb belgilaymiz.

Hosil qilingan

$$\{S_n^{(r)}\}$$

ketma-ketlikni "qirqilgqn" tasodifiy tentirash (K.T.T) deb ataymiz. (K.T.T)larning taqsimotlari katta sonlar qonunlari masalalari bo'yicha yapon, xitoy, koreys hamda o'zbek mutaxassislarining (va h.k lar) tadqiqotlari yaqin qillar ichida ko'plab ilmiy jurnallarda chop ettirilgan. Yechilgan muammolar "zarur" va "yetarli" xarakterga ega bo'lib, sifatiy tusda chop etilgan, lekin "miqdoriy" ko'rinishdagi natijalar bo'yicha tadqiqotlar yetarli darajada olib borilmagan.

Mening magistrlik dissertatsiyamning mavzusida "miqdoriy" natijalarga asosiy e'tibor qaratilgan. Maqsad – katta og'ishmalar ehtimolliklaridan tuzilgan qatorlar uchun Peli turidagi tengsizliklarni keltirib chiqarishdan iborat.
